

Product Specification: Document Collaboration Module V2.1

PRODUCT SPECIFICATION: DOCUMENT COLLABORATION MODULE V2.1

1. Technical Overview:

Our document editing platform utilizes a section-based locking synchronizer. When user A begins typing in a document section, the system locks that specific block. Changes are batched and synchronized at a sync interval of 2 seconds (2000ms sync window).

2. Known Constraints & Latency:

- Concurrent edits to the same section are blocked. If user B attempts to edit a locked section, the client receives a 'sync conflict' error, forcing manual merge select.
- Average request overhead routing latency is 120ms. EU-West region users experience higher routing overhead (averaging 240ms) as all API requests route through the US-East datacenter.
- Uptime is backed by a single-instance Redis cache (no master-slave replication active).
